

Super Admin Dashboard Plan

Product, operations, and delivery blueprint for the Cafe 6:18 multi-tenant platform.

PURPOSE

Define the first production-ready dashboard for platform operators. It should answer: Is the platform healthy? Are tenants growing and compliant? What requires action now?

Document scope

This plan covers the Super Admin web dashboard, not the cafe POS or an individual tenant back-office dashboard. It is designed for staff who operate the Cafe 6:18 SaaS platform.

Audience	Primary outcome	Frequency
Platform operator	Detect urgent tenant, revenue, and platform issues.	Daily
Platform manager	Track adoption, commercial health, and operational trends.	Weekly
Support / finance	Find tenants needing follow-up or reconciliation.	On demand

Recommended delivery order

First make the dashboard reliable and actionable; then add drill-down analytics. Avoid decorative charts before permissions, data freshness, and operational alerts are in place.

Prepared: 20 July 2026 | Language: English | Version: 1.0

1. Product goals and principles

- Provide a five-second health summary of the SaaS platform.
- Turn important changes into clear, permission-aware actions.
- Make every card traceable to a filtered tenant list, report, or detail page.
- Expose data freshness and calculation context; never show unexplained totals.
- Keep the first version desktop-first, responsive down to tablet width, and ready for Arabic RTL in the next localization slice.

NON-GOALS FOR V1

Do not duplicate POS operational screens, create a full BI warehouse, or replace dedicated tenant, billing, audit-log, and system-health pages. The dashboard should summarize and route users to those modules.

2. Information architecture

The dashboard should use one global time range and one global comparison period. A compact filter bar should remain visible at the top of the content area.

Zone	Content	Why it exists
Global header	Date range, timezone, currency display mode, refresh status, operator menu.	Sets reporting context and confidence.
Attention strip	Critical alerts and recommended actions.	Surfaces issues before metrics.
KPI row	Tenants, subscriptions, sales, orders, payment health.	Fast business pulse.
Trends	Sales / orders trend, tenant growth, subscription distribution.	Shows direction and anomalies.
Operational queues	At-risk trials, suspended tenants, failed jobs, support follow-ups.	Makes the page actionable.
Recent activity	Tenant events, security events, major platform changes.	Provides accountability and context.

3. Dashboard layout - recommended V1

Use a responsive twelve-column grid on desktop. At medium widths, stack charts and queues; retain the action strip and KPI row. This is a content blueprint, not a visual mockup.

Row	Modules	Interaction
1	Context bar: date range, comparison, refresh timestamp.	Changing filters refreshes all modules.
2	Attention strip: 0-5 highest-priority alerts.	Each alert opens its relevant detail or filtered list.
3	Six KPI cards.	Each card links to a drill-down with the same filters.
4	Sales & orders trend (8 cols) subscription mix (4 cols).	Hover tooltips and accessible data-table fallback.
5	Tenant growth (6 cols) platform health summary (6 cols).	Click a status segment to apply its filter.
6	Action queue (7 cols) recent activity (5 cols).	Deep links and acknowledgement where permitted.

4. Required KPI cards

Every KPI card must show a current value, delta versus the comparison period, definition tooltip, and data freshness. Amounts should be grouped by currency unless the platform has an approved conversion policy.

KPI	Definition	Primary drill-down	Priority
Active tenants	Tenants active at the end of the selected period.	Tenants filtered by status=active.	P0
New tenants	Tenants created during the selected period.	Tenant directory filtered by creation date.	P0
Trials ending soon	Trial subscriptions ending in next 7 / 14 days.	Subscriptions filtered by expiry.	P0
Suspended tenants	Tenants currently suspended.	Tenants filtered by status=suspended.	P0
Gross sales	Tenant order gross sales by original currency.	Analytics with same date range.	P1
Completed orders	Paid or completed orders, per agreed status contract.	Analytics / orders report.	P1
Subscription health	Active, trialing, past due, cancelled counts.	Subscriptions filtered by status.	P0
Platform health	Critical services and failed background jobs.	System Health.	P0

5. Charts, queues, and activity

Module	Minimum content	Rules
Sales and orders trend	Daily gross sales and completed orders; selectable 7, 30, 90 days.	Separate currencies or label an approved conversion policy.
Tenant growth	Created, activated, suspended tenants over time.	Use grouped bars or lines; period comparison available.
Subscription mix	Counts by plan and status.	Click a segment to open a filtered subscriptions list.
Action queue	Trials ending, past due, suspensions, onboarding failures, health incidents.	Rank by urgency; show owner, due date, and direct action.
Recent activity	Tenant created, status changed, plan changed, admin login/security event.	Show actor, timestamp, target, and audit-log deep link.
Platform health	API availability, queue failures, scheduled task health, error rate.	Show state, threshold, last check, and incident-history link.

ACTIONABILITY RULE

A dashboard item that cannot be investigated or acted on should not be promoted to the main page. Every warning needs an owner, a threshold, and a destination.

6. States, permissions, and trust

Concern	Required behavior
Authentication	Route guard calls /auth/me before rendering secured content. Unauthenticated users go to /login.
Authorization	Hide actions without permission, but enforce the same permission on Laravel APIs. Show a clear 403 state for denied direct URLs.
Loading and errors	Use skeletons for metrics/charts. Preserve successful modules and show retry for failed modules; never show failed data as zero.
Data freshness	Display Last updated and an explicit refresh control; show stale-data warning after an agreed threshold.
Accessibility and RTL	Keyboard navigation, visible focus, semantic tables, chart text equivalents, translation keys, and RTL-safe layout.

7. API and data requirements

The current backend exposes login, current user, dashboard metrics, tenant search/onboarding/detail, and tenant status updates. Dashboard V1 needs a stable aggregate contract plus drill-down links. Prefer a single dashboard endpoint for summary data, while preserving module-level failure reporting in the UI.

Endpoint / source	Needed for dashboard	Status
GET /auth/me	Session bootstrap, user name, permissions.	Existing
GET /dashboard	Core metrics, currency sales, recent tenants.	Existing; needs expansion
GET /tenants	Drill-down lists, pagination, filtering.	Existing; UI integration needed
GET /subscriptions	Trial/past-due queues, plan and status mix.	Required
GET /analytics/overview	Trends, growth, and revenue aggregation.	Required
GET /system/health	Service, queue, and status summary.	Required
GET /audit-logs	Recent platform activity.	Required
POST /auth/logout	Safe session termination.	Existing; UI integration needed

Recommended dashboard query parameters: from, to, compareTo, timezone, and currencyMode. Responses should include generatedAt, metric definitions/version, and a per-module status when feasible.

8. Delivery roadmap

Phase	Outcome	Key deliverables	Exit criteria
0 - Foundation	A buildable, secure shell.	Fix Next.js type error; route guard; logout; active navigation; shared loading/error components.	Production build passes; protected routes redirect correctly.
1 - Core dashboard	Reliable daily operating view.	Context bar, attention strip, six KPI cards, expanded API, empty/error/freshness states.	Operators can identify active tenants, trials, suspensions, sales, and platform status.
2 - Tenant operations	Actionable tenant lifecycle.	Tenant details, status-change UI, search/filter/pagination, onboarding validation.	Operator can find, inspect, onboard, and change tenant status.
3 - Commercial & health	Trends and exceptions.	Subscriptions, analytics trends, system health, audit logs, alert queue.	Every chart and alert has a verified drill-down.
4 - Hardening	Operational confidence.	RTL/i18n, accessibility audit, tests, performance checks, export jobs.	Acceptance checks pass and Arabic readiness is confirmed.

9. Acceptance checklist

- The page builds and type-checks successfully in the production pipeline.
- A signed-out user never sees protected data; a signed-in user only sees actions allowed by platform permissions.
- All KPI values have clear definitions, timeframe, comparison, and freshness information.
- The dashboard never treats a failed API call as zero data.
- Each card, chart segment, alert, and activity item reaches a valid filtered detail view.
- Currency presentation follows an approved policy and cannot silently mix currencies.
- Desktop, tablet, keyboard, and screen-reader behavior meet the agreed baseline.
- Automated tests cover authentication guard, loading/error/empty states, filter propagation, and major drill-down links.

10. Decisions to confirm before implementation

Decision	Why it matters	Suggested default
Revenue currency policy	Determines whether totals can be combined.	Show original-currency totals; add conversion only with a trusted FX source.
Completed order definition	Affects all sales/order metrics.	Document exact order and payment statuses in the API contract.
Alert ownership	Prevents ignored dashboard warnings.	Assign a team/role and escalation path to every alert type.
Data refresh target	Sets user expectations and implementation cost.	On-demand refresh plus visible timestamp; optimize live updates later.
Initial roles	Shapes which actions are visible.	Platform Super Admin, Operations, Support, Finance, Read-only Analyst.

RECOMMENDED NEXT STEP

Approve Phase 0 and the V1 KPI definitions, then implement the dashboard API contract and protected web shell together. This prevents visual work from being built on unstable data or unsecured routes.
